

TRAMPOLINE BED COMPARISONS

There are a few differences between the trampoline beds that we offer. The beds are either made of a Single Poly or a Double Poly material. The spring attachments of both these tramp beds have double webbed configuration for added strength.

The **Single Poly** bed only has one layer of polypropylene – making it lighter than the double poly bed, which gives it a better bounce. This bed is the most commonly used replacement trampoline bed. This is an ideal tramp bed for Age Group, High School and Collegiate diving programs and is recommended for both indoor and outdoor use. A UV Protectant has been applied to the stitching of this bed. Under normal conditions, there is a 5 – 10 year life for these beds based on use, care and sun exposure. This bed has a five year warranty against material defects and workmanship.

The **Double Poly** bed is manufactured using two sheets of polypropylene, which gives this bed LESS bounce because it is heavier than a single poly bed and because less air can pass through it. This bed is ideal for younger children’s programs (gymnastics and tumbling) where little bounce is desired or for a camp situation where many people will be bouncing the bed all day long. This bed does NOT have UV Protection on the stitching like the single poly bed so it is recommended for indoor use. However, if you choose to use this bed outdoors, it can be “flipped over” each year to extend its life by protecting it from damaging UV rays. This bed has only a two-year warranty against material defects and workmanship.

* * * * *

Both of these trampoline beds are washable with soap and water. We recommend that this be done periodically to clean the surface of the trampoline bed (oils, sweat, dust, dirt, etc.) Be sure to rinse the bed thoroughly before using again.
